December 5, 2017

Agenda

- 1 Overview
- 2 Ground Settings
 - Understanding Exceptions
 - Sequence of Events for Exception
- 3 Exception Syntax
 - Syntax
 - How it works
- 4 Example
- 5 Multiple Exceptions
- 6 Exceptions with members
- 7 Questions and Discussion

Overview

- **Exceptions:** errors that occur at run time
a variety of exception circumstances are:
 - running out of memory
 - failed to open a file
 - trying to initialize an object to incompatible value
 - index out-of-bounds
- provide a systematic, object-oriented approach to handling run-time errors generated by C++ classes

Agenda

- 1 Overview
- 2 Ground Settings

- 4 Example
- 5 Multiple Exceptions
- 6 Exceptions with members
- 7 Questions and Discussion

Understanding Exceptions

- mostly applications creates and interacts with objects of a certain class
- application's calls, to the class member functions cause no problem
- however, sometimes, application makes a mistake, causing an error to be detected in a member function
- given member function, in turn informs the application that a certain error has occurred called (**throwing** exception)
- in application we insert a separate section of code to handle this error called (**exception** handler or **catch** block)
- any code in application that uses objects of the class is enclosed in a **try** block
- generated errors will be caught in the **catch** block

Agenda

- 7 Questions and Discussion

Sequence of Events for Exception

- Upon rise of an exception the following sequence of events occurs
 - code is executing normally outside a **try** block
 - control enters the **try** block
 - a **statement** in **try** block causes an **error** in a **member function**
 - **member function** **throws** an exception
 - control transfers to the **exception handler** (**catch** block) following the **try** block

Agenda

- 2 Ground Settings
 - Understanding Exceptions
 - Sequence of Events for Exception
- 3 **Exception Syntax**
 - **Syntax**
 - How it works
- 4 Example
- 5 Multiple Exceptions
- 6 Exceptions with members
- 7 Questions and Discussion

Exception Syntax

Syntax

```
class A{  
    public:  
        class Error {};  
        void Some () {  
            if (/* condition */) {  
                throw Error();  
            }  
        };  
};  
  
int main() {  
    try {  
        A obj;  
        obj.Some();  
    }  
    catch(A::Error) {  
        /* inform user and handle the error */  
    }  
}
```

Agenda

- 1 Overview
- 2 Ground Settings
 - Understanding Exceptions
 - Sequence of Events for Exception
- 3 **Exception Syntax**
 - Syntax
 - **How it works**
- 4 Example
- 5 Multiple Exceptions
- 6 Exceptions with members
- 7 Questions and Discussion

How it works

- **Exception class:** an exception class (Error in prior slide) must be specified, which's name is used to connect a throw statement with a catch block
- **Throwing Exception:** when application is trying to make a mistake while manipulating an object, subsequently, throw an exception (throw Error() in prior slide)
- **Watch on Exception (try Block):** statements in `main()` that might cause given exception (i.e statements that manipulates given object) are enclosed in **try** block
- **Exception Handler (catch Block):** code that handles the exception given the exception class in parentheses; exception class must specify the class in which it is located, must immediately follow the **try** block

A Stack Example

- A Stack Example on board

Multiple Exceptions

- Explanation on board

Exceptions with members

- Descriptions on board
